

END-TO-END CI/CD PIPELINE USING JENKINS, DOCKER AND AWS EC2

ABSTRACT

Continuous Integration and Continuous Deployment (CI/CD) have become essential practices in modern software development. Manual deployment processes are time-consuming and error-prone. This project aims to automate the software delivery process using Jenkins, Docker, GitHub, Docker Hub, and AWS EC2. The developed system automatically builds, packages, and deploys an application whenever changes are pushed to the GitHub repository. GitHub Webhooks trigger Jenkins, which builds a Docker image, pushes it to Docker Hub, and deploys the latest container to an AWS EC2 instance. This reduces manual intervention and enables rapid and reliable application deployment.

CHAPTER 1: INTRODUCTION

1.1 Overview

Continuous Integration and Continuous Deployment (CI/CD) are software engineering practices that automate application build, testing, and deployment processes. This project implements a complete CI/CD pipeline that integrates GitHub, Jenkins, Docker, Docker Hub, and AWS EC2 to achieve automated application deployment.

1.2 Problem Statement

Traditional software deployment methods involve manual execution of build and deployment tasks, resulting in:

- Increased deployment time
- Human errors
- Inconsistent environments
- Reduced scalability

Therefore, an automated deployment system is required.

1.3 Objectives

- Automate application deployment.
- Integrate GitHub with Jenkins using Webhooks.
- Build Docker images automatically.
- Push Docker images to Docker Hub.
- Deploy containers on AWS EC2.
- Reduce manual effort and deployment time.

CHAPTER 2: LITERATURE REVIEW

Continuous Integration enables developers to integrate code changes frequently. Jenkins provides automation capabilities while Docker ensures portability through containerization. Cloud platforms such as AWS EC2 provide scalable infrastructure for hosting applications. Docker Hub acts as a centralized image repository enabling image distribution and version management.

CHAPTER 3: SYSTEM REQUIREMENTS

Hardware Requirements

Component Specification

Processor	Intel Core i5 or above
RAM	8 GB
Storage	256 GB SSD
Internet	Broadband Connection

Software Requirements

Software	Version
Windows 11	Latest
Git	2.53
Jenkins	2.555.2
Docker Desktop	Latest

Software	Version
GitHub	Cloud
Docker Hub	Cloud
AWS EC2	Ubuntu Instance
PowerShell	Latest

CHAPTER 4: SYSTEM ARCHITECTURE

Developer

GitHub Repository

GitHub Webhook

Jenkins Pipeline

Docker Build

Docker Hub

AWS EC2 Instance

Docker Container

Live Application

CHAPTER 5: IMPLEMENTATION

Step 1: Source Code Management

Application source code is maintained in a GitHub repository.

Repository:

<https://github.com/prats00017/devops-build>

Step 2: GitHub Webhook

GitHub sends POST requests to Jenkins whenever code is pushed to the repository.

Webhook Endpoint:

`http://<jenkins-server>/github-webhook/`

Step 3: Jenkins Pipeline

Pipeline Stages:

Clone Repository

Fetches latest source code from GitHub.

Build Docker Image

Command:

```
docker build -t prateek0017/devops-build-dev .
```

Docker Login

Authenticates with Docker Hub.

Push Docker Image

Command:

```
docker push prateek0017/devops-build-dev
```

Deploy to AWS EC2

Jenkins connects to EC2 using SSH and executes:

```
docker pull prateek0017/devops-build-dev
```

```
docker stop devops-build
```

```
docker rm devops-build
```

```
docker run -d -p 80:3000 --name devops-build prateek0017/devops-build-dev
```

CHAPTER 6: PIPELINE WORKFLOW

Git Push

Webhook Trigger

Jenkins Build

Docker Build

Docker Hub Push

SSH to EC2

Docker Deployment

Application Live

CHAPTER 7: RESULTS

The CI/CD pipeline successfully performs:

- Automatic code integration.
- Automatic Docker image creation.
- Docker image storage in Docker Hub.
- Automatic deployment to AWS EC2.
- Continuous delivery with minimal human intervention.

Live Application URL:

<http://43.205.138.8>

CHAPTER 8: ADVANTAGES

- Faster deployments
 - Reduced human errors
 - Continuous integration
 - Scalable architecture
 - Easy rollback and maintenance
 - Platform-independent deployment
-

CHAPTER 9: FUTURE SCOPE

- Kubernetes deployment using EKS.
 - Infrastructure provisioning using Terraform.
 - Monitoring using Prometheus and Grafana.
 - Reverse proxy with Nginx.
 - SSL certificate integration.
 - SonarQube integration for code quality.
 - Blue-Green deployment strategy.
-

CONCLUSION

The project successfully demonstrates an automated CI/CD pipeline using Jenkins, Docker, Docker Hub, and AWS EC2. The system eliminates manual deployment processes and enables continuous delivery with improved efficiency, scalability, and reliability. This implementation follows modern DevOps practices and can be extended further using Kubernetes and monitoring tools.
